

CRM Lead Sources Breakdown

Proposed ways a lead can enter SMPLFIX and how each source should be organized inside a dedicated CRM Leads section.

Recommended approach

Create one central Leads module with an All Leads view and source-specific sections. Every source should use the same lead record and pipeline so staff can work consistently while management can report results by platform.

Seven lead sources

LEAD SOURCE	HOW IT COMES IN	CRM CONNECTION	WHAT WE CAPTURE / DO
1. Website	A visitor submits a service request, contact form, landing page, or quote form on the SMPLFIX website.	Existing website form/webhook sends the submission directly into the CRM.	Create the lead automatically with name, phone, email, service, property address, notes, page/form name, and submission time.
2. Facebook & Instagram	A person completes a Meta Lead Ad form or sends an inquiry from a connected Facebook or Instagram business account.	Connect Meta Business Manager and the appropriate Pages/ad accounts through Meta lead access and an API/webhook integration.	Create the lead under the Meta source tab with campaign, ad, form, platform, contact details, message, and consent data.
3. Google	A prospect arrives through Google Ads, Local Services Ads, Google Business Profile, or a tracked Google landing page.	Connect supported Google lead sources and preserve UTM/campaign data on linked website forms. Other inquiries may enter through call tracking.	Store Google channel, campaign/ad information, search or landing-page attribution when available, and the original inquiry details.
4. Email	A prospect emails a public address such as sales@smplfix.com or a dedicated leads inbox.	Connect a shared mailbox or use email forwarding/parsing to create a CRM lead from a new inquiry.	Capture sender, subject, message, attachments, received time, and conversation history. Staff can correct the service and customer fields.
5. Phone & SMS	A prospect calls or texts the business number, including calls generated by ads, listings, or referrals.	Use a connected phone/call-tracking provider, or let staff create a lead from the call screen when no integration is available.	Capture caller number, call source/tracking number, date, duration, notes, recording link if permitted, service needed, and follow-up owner.
6. Referrals & Partners	A lead is referred by an existing customer, vendor, employee, property manager, realtor, HOA, or business partner.	Provide a referral form/link and a manual referral option inside the CRM.	Store the referring person/company, referral type, reward or agreement reference, relationship, and the new prospect's contact/service details.
7. Manual, Events & Imports	Staff enters a lead received through networking, walk-in contact, direct outreach, trade events, lists, or another offline source.	Use a New Lead form for individual records and a controlled CSV import for approved lead lists.	Require a specific source and campaign/event label. Track who entered/imported the lead, import date, consent status, and any follow-up notes.

Proposed Leads section

All Leads	One combined view of every lead, regardless of source.
Source sections	Website; Facebook & Instagram; Google; Email; Phone & SMS; Referrals & Partners; Manual & Imports.
Saved work queues	New, Unassigned, Follow-up Due, Qualified, Quote Needed, and Stale Leads.
Lead pipeline	New -> Contacted -> Qualified -> Quote/Estimate -> Won or Lost.

Information stored on every lead

Contact	Name, phone, email, preferred contact method, and communication consent.
Service need	Service category, request description, urgency, property address, and attachments.
Attribution	Primary source, platform, campaign, ad/form, landing page, referral partner, and original source details.
Ownership	Assigned staff member, priority, status, next follow-up date, and last-contact time.
History	Emails, calls, texts, notes, status changes, appointments, and related documents.
Outcome	Converted customer/order, estimated value, won/lost date, and standardized lost reason.

Recommended CRM automation

Automatic assignment	Route leads by service category, location, source, or staff availability; keep an Unassigned queue as a safety net.
Duplicate checking	Match phone and email before creating a new person. Add a new inquiry to an existing lead/customer when appropriate.
Fast response	Notify the assigned owner immediately and create a follow-up task. Escalate new leads that remain untouched past the agreed response time.
Source protection	Keep the original source permanently for reporting, even if staff later updates the current campaign or channel.
Conversion tracking	When a lead becomes an order, link the records so revenue and close rate can be reported by source.

Client decisions needed before integration

Confirm which Meta Business Manager, Facebook Page, Instagram account, Google advertising/business accounts, shared email inbox, and phone provider will be connected. Also confirm lead ownership rules, response-time target, permitted communication channels, and referral tracking requirements.

Implementation note

Website leads can continue using the existing CRM intake flow. The other platform connections are proposed integrations and require account access, permissions, provider setup, and final field mapping before development.
